

Accessing the safety sensor on milk jug

Remove the lower main board access door

Inside the game you will see the bottom of the pan that the balls roll down. Mounted to that pan is the safety sensor

There is an indicator led on the sensor, normal operation when the game is in attract mode the LED will be flashing, when you coin the game up the led will go off and then when you block the sensor the led will turn on. There is an adjustment for the sensitivity of the sensor. It is located along the back edge of sensor to the right of the connector. Turning the adjustment all the way towards the connector will set it to the least sensitive position.
